The first two slides of this talk can be taken from Bradd's talk. In particular, we will work in the setting of $\rm C^*\mbox{-algebras}.$

Definition

A trace τ on a C*-algebra A is a linear functional $\tau: A \to \mathbb{C}$ with $\|\tau\| = 1$, $\tau(aa^*) \ge 0$ and $\tau(ab) = \tau(ba)$ for all $a, b \in A$. τ is faithful if $\tau(aa^*) = 0$ implies a = 0.

If A and B are C*-algebras, σ, τ traces on A and B resp., and ϕ is such that $\tau(\phi(a)) = \sigma(a)$ for all $a \in A$, ϕ is said trace preserving, denoted $\phi: (A, \sigma) \to (B, \tau)$. If A and B are unital the pullback of a trace is a trace, so every unital embedding is trace preserving for some traces.

If we consider the language of C^* -algebra together with a trace, trace preserving injections are exactly our embeddings.

The first two slides of this talk can be taken from Bradd's talk. In particular, we will work in the setting of $\rm C^*\mbox{-algebras}.$

Theorem (EFHKKL, Masumoto)

The class $\{(Z_{p,q}, \tau) \mid p, q \text{ coprimes}, \tau \text{ faithful trace}\}$ is a Fraïssé class. \mathcal{Z} is its Fraïssé limit.

So for all p, q coprimes, $\phi_1, \phi_2 \colon Z_{p,q} \to \mathcal{Z}$, $F \subseteq Z_{p,q}$ and $\epsilon > 0$ there is an automorphism ρ of \mathcal{Z} such that

 $\|\rho(\phi_1(a)) - \phi_2(a)\| < \epsilon$

for all $a \in F$.

EFHKKL's Proof is based on some known facts about \mathcal{Z} . Masumoto's one on a careful study of what the maps between dimension drop algebras can be.

Question

As we know that $Z \cong Z \otimes Z$, what can we say about maps $\phi_1, \phi_2: Z_{p,q} \otimes Z_{p',q'} \to Z$? In other terms, can we prove that Z and $Z \otimes Z$ are the Fraïssé limit of the same class?

This is more difficult than one can think. In fact, maps $Z_{p,q} \otimes Z_{p,q} \rightarrow Z_{p',q'} \otimes Z_{p',q'}$ are more complicated than one can think. Despite that, maps $Z_{p,q} \otimes Z_{p',q'} \rightarrow Z_{p'',q''}$ are always well behaved.

Theorem (Jacelon-V.)

The class $\{(Z_{p,q}, \tau), (Z_{p,q} \otimes Z_{p',q'}, \sigma)\}$ is a Fraïssé class. Both \mathcal{Z} and $\mathcal{Z} \otimes \mathcal{Z}$ are its Fraïssé limits, so $\mathcal{Z} \cong \mathcal{Z} \otimes \mathcal{Z}$.

Question

As we know that $Z \cong Z \otimes Z$, what can we say about maps $\phi_1, \phi_2: Z_{p,q} \otimes Z_{p',q'} \to Z$? In other terms, can we prove that Z and $Z \otimes Z$ are the Fraïssé limit of the same class?

This is more difficult than one can think. In fact, maps $Z_{p,q} \otimes Z_{p,q} \rightarrow Z_{p',q'} \otimes Z_{p',q'}$ are more complicated than one can think. Despite that, maps $Z_{p,q} \otimes Z_{p',q'} \rightarrow Z_{p'',q''}$ are always well behaved.

Theorem (Jacelon-V.)

The class $\{(Z_{p,q}, \tau), (Z_{p,q} \otimes Z_{p',q'}, \sigma)\}$ is a Fraïssé class. Both \mathcal{Z} and $\mathcal{Z} \otimes \mathcal{Z}$ are its Fraïssé limits, so $\mathcal{Z} \cong \mathcal{Z} \otimes \mathcal{Z}$.

Let

$A_{n,k} = C([0,1], M_n \otimes M_k) \mid f(0) = 1 \otimes c, f(1) = 1_{n-1} \otimes c\}$

These are called Razak's blocks. Traces are, as before, given by probability measures on the interval. The absence of the unit doesn't allow to say that every embedding of $A_{n,k} \rightarrow A_{n',k'}$ is trace preserving.

Proposition

If σ, τ are faithful diffuse traces on A_{n,k} then there is an isomorphism (A_{n,k}, σ) → (A_{n,k}, τ)

If p ≥ 2 and τ, σ are faithful traces on A_{n,k} and A_{pn,(pn-1)k}, τ being diffuse, there is a trace preserving embedding φ: (A_{n,k}, σ) → (A_{pn,(pn-1)k}, τ).

Theorem (Jacelon)

There are increasing sequences n_i , k_i and trace preserving (for some traces) maps $\phi_i : A_{n_i,k_i} \rightarrow A_{n_{i+1},k_{i+1}}$ such that $\mathcal{W} = \lim_i (A_{n_i,k_i}, \phi_i)$ is simple, stably projectionless monotracial and with trivial K-theory. Let n_i , k_i and ψ_i and $A = \lim_{i \to \infty} (A_{n_i,k_i}, \psi_i)$. If A is simple monotracial stably projectionless and with trivial K-theory, then $A \cong \mathcal{W}$.

Recent work of Elliott-Niu and Gong-Lin showed the first evidences that \mathcal{W} plays the same role in the classification of nonunital algebras as \mathcal{Z} does for the unital case. \mathcal{W} is a universal objects in many ways. On the other hand, that $\mathcal{W} \otimes \mathcal{W} \cong \mathcal{W}$ was only recently proved, involving a long and complicated proof in classification theory.

Theorem (Jacelon-V.)

The class $\{(A_{n,k}, \sigma) \mid \sigma \text{ is a faithful trace}\}$ is a Fraïssé class. W is its limit.

Whenever $\phi_1, \phi_2: (A_{n,k}, \sigma) \to (W, \tau)$ are embeddings for some faithful diffuse σ and $F \subseteq A_{n,k}$ and $\epsilon > 0$ are given there is an automorphism ρ of W such that

$$\|\rho(\phi_1(a)) - \phi_2(a)\| < \epsilon$$

for $a \in F$.

The techniques used are similar to the ones of Masumoto's proof that $\ensuremath{\mathcal{Z}}$ is a Fraïssé limit.

《曰》《聞》《臣》《臣》 [臣]

The goal is to reproduce the argument used for $\{(Z_{p,q}, \tau), (Z_{p,q} \otimes Z_{p',q'}, \sigma)\}$ to show that $\{(A_{n,k}, \sigma), (A_{n,k} \otimes A_{n',k'}, \tau)\}$ is a Fraïssé class.

Proposition

Fix n, k.

- There are well-behaved maps $A_{n,k} \rightarrow A_{n',k'}$ for some n', k'.
- There are well-behaved maps $A_{n,k} \otimes A_{n,k} \rightarrow A_{n',k'}$ for some n', k'.

Problem

Not all maps $A_{n,k} \otimes A_{n,k} \rightarrow A_{n',k'}$ are well-behaved. Proving NAP seems difficult. Also, there is no well-behaved trace preserving map $A_{n,k} \rightarrow A_{n',k'} \otimes A_{n'',k''}$

Question

Is there any trace preserving map $A_{n,k} \rightarrow A_{n',k'} \otimes A_{n',k'}$? Do we need to add more structure and remove the trace?

Theorem (Eagle-Farah-Kirchberg-V., Eagle-Goldbring-V.)

- In the language of unital C^{*}-algebras, the only C^{*}-algebras with QE are C, C², M₂(C) and C(2^N).
- The only nonabelian C^* -algebra with (\star) is $M_2(\mathbb{C})$.

→ 母 ▶ → 国 ▶ → 国 ▶ → 句 ♥ ♥

If A is a Fraïssé limit for the Fraïssé class \mathcal{K} , for all the examples we have, A satisfies (*) whenever $F \in \mathcal{K}$. This is where the absence of HP kicks in.

Question

Does Z satisfy (*) in the language of tracial unital C*-algebras? Does it have QE?

Question

What is the largest class of algebras for which $\mathcal W$ satisfies (*) in the language of tracial C^* -algebras?
