# Possible explanations

Debt  
dynamics in  
the Great  
Moderation  
and beyond

M. R. Grasselli

Empirical  
analysis:  
Grydaki and  
Bezemer  
(2013)

The basic  
model

The extended  
model with  
speculation

- Real-sector causes: inventory management, labour market changes, responses to oil shocks, external balances , etc.
- Financial-sector causes: credit accelerator models, financial innovation, deregulation, better monetary policy, etc.
- Grydaki and Bezemer (2013): growth of debt in the real sector.

Figure: Grydaki and Bezemer (2013)

Debt dynamics in the Great Moderation and beyond

M. R. Grasselli

Empirical analysis: Grydaki and Bezemer (2013)

The basic model

The extended model with speculation

# Excess credit growth moderated output volatility during, but not before the Great Moderation

Debt dynamics in the Great Moderation and beyond

M. R. Grasselli

Empirical analysis: Grydaki and Bezemer (2013)

The basic model

The extended model with speculation

	<i>Before the Great Moderation</i>	<i>During the Great Moderation</i>
	change in interest rate (-) => output volatility	excess credit growth (-) => output volatility
	change in interest rate (+) => inflation	output volatility (+) => excess credit growth
	excess credit growth (+) => change in interest rate	output volatility (-) => change in interest rate
		excess credit growth (+) => change in interest rate
		inflation (+) => change in interest rate

Note: In the table,  $x (-) \Rightarrow y$  denotes that a one-standard deviation shock in variable  $x$  impacts negatively on the change of variable  $y$ . Similarly,  $x (+) \Rightarrow y$  indicates a positive impact.

## Special case: Keen (1995)

Debt  
dynamics in  
the Great  
Moderation  
and beyond

M. R. Grasselli

Empirical  
analysis:  
Grydaki and  
Bezemer  
(2013)

The basic  
model

The extended  
model with  
speculation

- Let  $D = L - M_f$  and assume that  $r_M = r_F = r$ .
- Supposing further that  $\Phi = \Phi(\lambda)$  and  $I = \kappa(\pi)Y$ , where  $\pi = 1 - \omega - rd$ , leads to

$$\dot{\omega} = \omega [\Phi(\lambda) - \alpha]$$

$$\dot{\lambda} = \lambda \left[ \frac{\kappa(1 - \omega - rd)}{\nu} - \alpha - \beta - \delta \right] \quad (1)$$

$$\dot{d} = d \left[ r - \frac{\kappa(1 - \omega - rd)}{\nu} + \delta \right] + \kappa(1 - \omega - rd) - (1 - \omega)$$

- The system (1) has a good equilibrium at

$$\bar{w} = 1 - \bar{\pi} - r \frac{\nu(\alpha + \beta + \delta) - \bar{\pi}}{\alpha + \beta}$$

$$\bar{\lambda} = \Phi^{-1}(\alpha)$$

$$\bar{d} = \frac{\nu(\alpha + \beta + \delta) - \bar{\pi}}{\alpha + \beta}$$

with

$$\bar{\pi} = \kappa^{-1}(\nu(\alpha + \beta + \delta)),$$

which is stable for a large range of parameters

- It also has a bad equilibrium at  $(0, 0, +\infty)$ , which is stable if

$$\frac{\kappa(-\infty)}{\nu} - \delta < r \quad (2)$$

# Example 1: convergence to the good equilibrium in a Keen model

Debt  
dynamics in the

(2013)

The basic  
model

The extended  
model with  
speculation

$$\omega_0 = 0.8, \lambda_0 = 0.722, d_0 = 0.1, Y_0 = 100, \kappa(\pi_{eq}) = 100$$

# Adding speculation by firms

Debt  
dynamics in  
the Great  
Moderation  
and beyond

M. R. Grasselli

Empirical  
analysis:  
Grydaki and  
Bezemer  
(2013)

The basic  
model

The extended  
model with  
speculation

- As one way to explain credit growth in excess of GDP growth, GB 2013 observe that “there is extensive evidence that during the Great Moderation nonfinancial firms increasingly realized their returns in financial transactions”.
- We model this by introducing Ponzi speculation in the form

$$\begin{aligned}\dot{D} &= \kappa(1 - \omega - rd)Y - (1 - \omega - rd)Y + P \\ \dot{P} &= \Psi(g(\omega, d)P)\end{aligned}$$

where

$$g(\omega, d) = \frac{\kappa(1 - \omega - rd)}{\nu} - \delta,$$

is the growth rate of the economy.

# Example 4: strongly moderated oscillations

Debt  
dynamics in  
the Great  
Moderation  
and beyond

The basic  
model

The extended  
model with  
speculation

$$\omega_0 = 0.9, \lambda_0 = 0.91, d_0 = 0.1, p_0 = 0.01, Y_0 = 100, \kappa'(\pi_{\text{eq}}) = 20$$

Debt  
dynamics in  
the Great  
Moderation  
and beyond

M. R. Grasselli

Empirical  
analysis:  
Grydaki and  
Bezemer  
(2013)

The basic  
model

The extended  
model with  
speculation

- Stability is destabilizing!
- In boom times, debt-financing decreases volatility, but leads to excessive leverage.
- Price stability is not enough: capital requirements should go hand-in-hand with monetary policy.
- After a crash, deleveraging is the dominant effect.
- Debt relief is much more important than monetary easing.

Debt  
dynamics in  
the Great  
Moderation  
and beyond

M. R. Grasselli

Empirical  
analysis:  
Grydaki and  
Bezemer  
(2013)

The basic  
model

The extended  
model with  
speculation

- Joint work with Grydaki and Bezemer to calibrate the theoretical model to empirical data.
- Investigate the stable-unstable phenomenon in the context of Shilnikov's saddle-node bifurcations.
- Extend the model to incorporate price dynamics and other types of speculation (e.g real estate).
