Goodwin Model (1967) - Assumptions

- Assume that

$$N(t) = N_0 e^{\beta t} \quad (\text{total labour force})$$

$$a(t) = a_0 e^{\alpha t} \quad (\text{productivity per worker})$$

$$Y(t) = \nu K(t) = a(t)L(t) \quad (\text{total yearly output})$$

where K is the total stock of capital and L is the employed population.

Goodwin Model (1967) - Assumptions

- Assume that

$$N(t) = N_0 e^{\beta t} \quad (\text{total labour force})$$

$$a(t) = a_0 e^{\alpha t} \quad (\text{productivity per worker})$$

$$Y(t) = \nu K(t) = a(t)L(t) \quad (\text{total yearly output})$$

where K is the total stock of capital and L is the employed population.

- Assume further that

$$\dot{w} = \Phi(\lambda)w \quad (\text{Phillips curve})$$

$$\dot{K} = (Y - wL) - \delta K \quad (\text{Say's Law})$$

Goodwin Model - Differential equations

A dynamical systems model for credit expansion, asset price bubbles and financial fragility

M. R. Grasselli

Introduction

Goodwin model

Keen model

Ponzi financing

Stabilizing government

- Define

$$\omega = \frac{wL}{Y} = \frac{w}{a} \quad (\text{wage share})$$

$$\lambda = \frac{L}{N} = \frac{Y}{aN} \quad (\text{employment rate})$$

- Define

$$\omega = \frac{wL}{Y} = \frac{w}{a} \quad (\text{wage share})$$

$$\lambda = \frac{L}{N} = \frac{Y}{aN} \quad (\text{employment rate})$$

- It then follows that

$$\dot{\omega} = \omega(\Phi(\lambda) - \alpha) \quad (1)$$

$$\dot{\lambda} = \lambda \left(\frac{1 - \omega}{\nu} - \alpha - \beta - \delta \right) \quad (2)$$

Goodwin Model - Properties

A dynamical systems model for credit expansion, asset price bubbles and financial fragility

M. R. Grasselli

Introduction

Goodwin model

Keen model

Ponzi financing

Stabilizing government

- If we take Φ to be linear, (1) reduces to the Lotka-Volterra equations for the predator-prey model.

Goodwin Model - Properties

- If we take Φ to be linear, (1) reduces to the Lotka-Volterra equations for the predator-prey model.
- To ensure $\lambda \in (0, 1)$ we take

$$\Phi(\lambda) = \frac{\phi_1}{(1 - \lambda)} - \phi_0$$

Goodwin Model - Properties

- If we take Φ to be linear, (1) reduces to the Lotka-Volterra equations for the predator-prey model.
- To ensure $\lambda \in (0, 1)$ we take

$$\Phi(\lambda) = \frac{\phi_1}{(1 - \lambda)} - \phi_0$$

- Provided

$$\begin{aligned} \frac{1}{\nu} - \alpha - \beta - \delta &> 0 \\ \alpha + \phi_0 - \rho_1 &> 0 \end{aligned} \tag{3}$$

are satisfied, the trivial equilibrium $(0, 0)$ is a saddle point.

- If we take Φ to be linear, (1) reduces to the Lotka-Volterra equations for the predator-prey model.

A dynamical systems model for credit expansion, asset price bubbles and financial fragility

M. R. Grasselli

Introduction

Goodwin model

Keen model

Ponzi financing

Stabilizing government

Introducing a financial sector (Keen 1995)

- Assume now that new investment is given by

$$\dot{K} = \kappa(1 - \omega - rd)Y - \delta K \quad (5)$$

where $\kappa(\cdot)$ is an increasing function the net profit share $\pi = 1 - \omega - rd$.

Introducing a financial sector (Keen 1995)

- Assume now that new investment is given by

$$\dot{K} = \kappa(1 - \omega - rd)Y - \delta K \quad (5)$$

where $\kappa(\cdot)$ is an increasing function the net profit share $\pi = 1 - \omega - rd$.

- This leads to external financing through debt evolving according to

$$\dot{D} = \kappa(1 - \omega - rd)Y - (1 - \omega - rd)Y$$

Introducing a financial sector (Keen 1995)

- Assume now that new investment is given by

$$\dot{K} = \kappa(1 - \omega - rd)Y - \delta K \quad (5)$$

where $\kappa(\cdot)$ is an increasing function the net profit share $\pi = 1 - \omega - rd$.

- This leads to external financing through debt evolving according to

$$\dot{D} = \kappa(1 - \omega - rd)Y - (1 - \omega - rd)Y$$

- We take

$$\kappa(x) = \kappa_0 + \kappa_1 e^{\kappa_2 x},$$

for constants

$$\kappa_0 < \nu(\alpha + \beta + \delta), \quad \kappa_1 > 0, \quad \kappa_2 > 0. \quad (6)$$

Denote the debt ratio in the economy by $d = D/Y$, the model can now be described by the following system

$$\begin{aligned}\dot{\omega} &= \omega \left[\frac{\phi_1}{(1-\lambda)^2} - (\alpha + \phi_0) \right] \\ \dot{\lambda} &= \lambda \left[\frac{\kappa(1-\omega-rd)}{\nu} - \alpha - \beta - \delta \right] \\ \dot{d} &= d \left[r - \frac{\kappa(1-\omega-rd)}{\nu} + \delta \right] + \kappa(1-\omega-rd) - (1-\omega)\end{aligned}\tag{7}$$

- If we define

$$\bar{\pi}_1 = \kappa^{-1}(\nu(\alpha + \beta + \delta)) = \frac{1}{\kappa_2} \log \left(\frac{\nu(\alpha + \beta + \delta) - \kappa_0}{\kappa_1} \right)$$

we see that one possible equilibrium for (7) is

$$\bar{w}_1 = 1 - \bar{\pi}_1 - r \frac{\nu(\alpha + \beta + \delta) - \bar{\pi}_1}{\alpha + \beta}$$

$$\bar{\lambda}_1 = 1 - \sqrt{\frac{\phi_1}{\alpha + \phi_0}} \tag{8}$$

$$\bar{d}_1 = \frac{\nu(\alpha + \beta + \delta) - \bar{\pi}_1}{\alpha + \beta}$$

- Other equilibrium points are given by

$$(\bar{\omega}_2, \bar{\lambda}_2, \bar{d}_2) = (0, 0, \bar{d}_2) \quad (9)$$

where \bar{d}_2 is any solution of the equation

$$d \left[r - \frac{\kappa(1 - rd)}{\nu} + \delta \right] + \kappa(1 - rd) - 1 = 0$$

- Other equilibrium points are given by

$$(\bar{w}_2, \bar{\lambda}_2, \bar{d}_2) = (0, 0, \bar{d}_2) \quad (9)$$

where \bar{d}_2 is any solution of the equation

$$d \left[r - \frac{\kappa(1 - rd)}{\nu} + \delta \right] + \kappa(1 - rd) - 1 = 0$$

- Another set of equilibrium points are

$$(\bar{w}_3, \bar{\lambda}_3, \bar{d}_3) = (0, \lambda, \bar{d}_1) \quad (10)$$

provided $1 - r\bar{d}_1 = \bar{\pi}_1$, that is

$$1 - r \frac{\nu(\alpha + \beta + \delta) - \kappa^{-1}(\nu(\alpha + \beta + \delta))}{\alpha + \beta} = \kappa^{-1}(\nu(\alpha + \beta + \delta))$$

Example 2 : convergent Keen model

Example 2 (continued): convergent Keen model

A dynamical systems model for credit expansion, asset price bubbles and financial fragility

M. R. Grasselli

Introduction

Goodwin model

Keen model

Ponzi financing

Stabilizing government

- If we rewrite the system with the change of variables $u = 1/d$, we obtain

$$\begin{aligned}\dot{\omega} &= \omega \left[\frac{\phi_1}{(1-\lambda)^2} - (\alpha + \phi_0) \right] \\ \dot{\lambda} &= \lambda \left[\frac{\kappa(1-\omega-r/u)}{\nu} - \alpha - \beta - \delta \right] \\ \dot{u} &= u \left[\frac{\kappa(1-\omega-r/u)}{\nu} - r - \delta \right] - u^2 [\kappa(1-\omega-r/u) - (1-\omega)]\end{aligned}\tag{11}$$

- If we rewrite the system with the change of variables $u = 1/d$, we obtain

$$\begin{aligned}\dot{\omega} &= \omega \left[\frac{\phi_1}{(1-\lambda)^2} - (\alpha + \phi_0) \right] \\ \dot{\lambda} &= \lambda \left[\frac{\kappa(1-\omega-r/u)}{\nu} - \alpha - \beta - \delta \right] \\ \dot{u} &= u \left[\frac{\kappa(1-\omega-r/u)}{\nu} - r - \delta \right] - u^2 [\kappa(1-\omega-r/u) - (1-\omega)]\end{aligned}\tag{11}$$

- We now see that $(0, 0, 0)$ is an equilibrium of (11) corresponding to the point

$$(\bar{\omega}_4, \bar{\lambda}_4, \bar{d}_4) = (0, 0, +\infty)\tag{12}$$

for the original system.

- Analyzing the Jacobian of (7) and (11) we obtain the following conclusions.

- Analyzing the Jacobian of (7) and (11) we obtain the following conclusions.
- The good equilibrium $(\bar{\omega}_1, \bar{\lambda}_1, \bar{d}_1)$ is stable if and only if

$$r \left[\kappa'(\bar{\pi}_1) \left(\frac{\bar{\pi}_1}{\nu} - \delta \right) - (\alpha + \beta) \right] > 0.$$

- Analyzing the Jacobian of (7) and (11) we obtain the following conclusions.
- The good equilibrium $(\bar{\omega}_1, \bar{\lambda}_1, \bar{d}_1)$ is stable if and only if

$$r \left[\kappa'(\bar{\pi}_1) \left(\frac{\bar{\pi}_1}{\nu} - \delta \right) - (\alpha + \beta) \right] > 0.$$

- The second equilibrium $(0, 0, \bar{d}_2)$ is unstable whenever

$$\kappa(1 - r\bar{d}_2) > \kappa(1 - \bar{\omega}_1 - r\bar{d}_1)$$

Keen model - Local stability

- Analyzing the Jacobian of (7) and (11) we obtain the following conclusions.
- The good equilibrium $(\bar{\omega}_1, \bar{\lambda}_1, \bar{d}_1)$ is stable if and only if

$$r \left[\kappa'(\bar{\pi}_1) \left(\frac{\bar{\pi}_1}{\nu} - \delta \right) - (\alpha + \beta) \right] > 0.$$

- The second equilibrium $(0, 0, \bar{d}_2)$ is unstable whenever

$$\kappa(1 - r\bar{d}_2) > \kappa(1 - \bar{\omega}_1 - r\bar{d}_1)$$

- The third equilibrium $(0, \lambda, \bar{d}_1)$ is structurally unstable.

- Analyzing the Jacobian of (7) and (11) we obtain the following conclusions.
- The good equilibrium $(\bar{\omega}_1, \bar{\lambda}_1, \bar{d}_1)$ is stable if and only if

$$r \left[\kappa'(\bar{\pi}_1) \left(\frac{\bar{\pi}_1}{\nu} - \delta \right) - (\alpha + \beta) \right] > 0.$$

- The second equilibrium $(0, 0, \bar{d}_2)$ is unstable whenever

$$\kappa(1 - r\bar{d}_2) > \kappa(1 - \bar{\omega}_1 - r\bar{d}_1)$$

- The third equilibrium $(0, \lambda, \bar{d}_1)$ is structurally unstable.
- The point $(0, 0, 0)$ is a stable equilibrium for (11) if and only if

$$\frac{\kappa_0}{\nu} < \min(\alpha + \beta + \delta, r + \delta)$$

Basin of convergence for Keen model

A dynamical systems model for credit expansion, asset price bubbles and financial fragility

M. R. Grasselli

Introduction

Goodwin model

Keen model

Ponzi financing

Stabilizing government

To introduce the destabilizing effect of purely speculative investment, Keen (2009) considers a modified version of the previous model with

$$\begin{aligned}\dot{D} &= \kappa(1 - \omega - rd)Y - (1 - \omega - rd)Y + P \\ \dot{P} &= \Psi(g)Y\end{aligned}$$

where $\Psi(\cdot)$ is an increasing function of the growth rate of economic output

$$g = \frac{\kappa(1 - \omega - rd)}{\nu} - \delta.$$

Denoting $\Psi(\omega, d) = \Psi\left(\frac{\kappa(1-\omega-rd)}{\nu} - \delta\right)$, the system now becomes

$$\dot{\omega} = \omega \left[\frac{\phi_1}{(1-\lambda)^2} - (\alpha + \phi_0) \right]$$

$$\dot{\lambda} = \lambda \left[\frac{\kappa(1-\omega-rd)}{\nu} - \alpha - \beta - \delta \right]$$

$$\dot{d} = d \left[r - \frac{\kappa(1-\omega-rd)}{\nu} + \delta \right] + \kappa(1-\omega-rd) - (1-\omega) + p$$

$$\dot{p} = \Psi(\omega, d) - \left(\frac{\kappa(1-\omega-rd)}{\nu} - \delta \right) p$$

- The finite debt equilibrium for the new system has $\bar{\pi}_1$ and $\bar{\lambda}_1$ as before, but

$$\bar{\omega}_1 = 1 - \bar{\pi}_1 - r\bar{d}_1$$

$$\bar{d}_1 = \frac{\nu(\alpha + \beta + \delta) - \bar{\pi}_1 + \bar{p}_1}{\alpha + \beta}$$

$$\bar{p}_1 = \frac{\Psi(\alpha + \beta)}{\alpha + \beta}$$

and is now unstable for typical model parameters.

- The finite debt equilibrium for the new system has $\bar{\pi}_1$ and $\bar{\lambda}_1$ as before, but

$$\bar{\omega}_1 = 1 - \bar{\pi}_1 - r\bar{d}_1$$

$$\bar{d}_1 = \frac{\nu(\alpha + \beta + \delta) - \bar{\pi}_1 + \bar{p}_1}{\alpha + \beta}$$

$$\bar{p}_1 = \frac{\Psi(\alpha + \beta)}{\alpha + \beta}$$

and is now unstable for typical model parameters.

- On the other hand, introducing $u = 1/d$ and $v = 1/p$ we find that

$$(\omega, \lambda, d, p) = (0, 0, +\infty, -\infty)$$

$$(\omega, \lambda, d, p) = (0, 0, +\infty, +\infty)$$

correspond to stable equilibria for the modified system.

Example 4: effect of Ponzi financing

- A final extension proposed by Keen (echoing Minsky) consists of adding government spending and taxation into the original system according to

$$\dot{G} = \Gamma(\lambda)Y$$

$$\dot{T} = \Theta(\pi)Y$$

- Defining $g = G/Y$ and $t = T/Y$, the net profit share is now

$$\pi = 1 - \omega - rd + g - t$$

Ponzi financing

Stabilizing government

- Model prices for capital goods P_k and commodities P_c explicitly (Kaleckian mark-up theory, inflation, etc)
- Introduce noise (stochastic interest rates, risk premium, etc)
- Calibrate to macroeconomic time series.

- Solow (1990): The true test of a simple model is whether it helps us to make sense of the world. Marx was, of course, dead wrong about this. We have changed the world in all sorts of ways, with mixed results; the point is to interpret it.
