

ASSIGNMENT 52

1. (a) P_0 is a function of τ

since $e^{\text{anything}} > 0$, the denominator is always > 1
 so never zero \rightarrow domain is all real numbers

because of context: domain for τ is $\tau > 0$

(b) P_0 is a quotient of two positive numbers, so $P_0 > 0$

as well
$$P_0 = \frac{1}{\text{quantity larger than 1 (see (a))}} < 1$$

(c) $e^{\beta(\Delta G - \tau \Delta A)}$ term:

as $\tau \rightarrow \infty$, $\tau \Delta A \rightarrow \infty$ (since $\Delta A > 0$)

then $-\tau \Delta A \rightarrow -\infty$

$\Delta G - \tau \Delta A \rightarrow -\infty$ (no matter what ΔG is)

$\beta(\Delta G - \tau \Delta A) \rightarrow -\infty$ (since $\beta > 0$)

$$e^{\beta(\Delta G - \tau \Delta A)} \rightarrow e^{-\infty} = 0$$

thus, P_0 approaches $\frac{1}{1+0} = 1$

2. (a)
$$\lim_{d \rightarrow \infty} \frac{1}{(1 + d/\alpha)^f} = \frac{1}{\infty} = 0$$
 since $1 + \frac{d}{\alpha} \rightarrow \infty$
 and $(1 + \frac{d}{\alpha})^f \rightarrow \infty$
 (as $f > 0$)

(b)
$$\lim_{d \rightarrow \infty} \frac{1}{(1 + d/\alpha)^f} = \frac{1}{0} = \infty$$
 since $1 + \frac{d}{\alpha} \rightarrow \infty$
 and $f < 0$, $-(1 + \frac{d}{\alpha})^f \rightarrow 0$

} IF $f < 0$ this is not a fraction!

$$(c) \quad \lim_{d \rightarrow 0} \frac{1}{\left(1 + \frac{d}{\alpha}\right)^\alpha} = \frac{1}{1} = 1$$

$$(d) \quad \text{because } \lim_{d \rightarrow 0} f(d) = 1 \neq \pi = f(0)$$

we see that f is not continuous at $d=0$.

$$3. (a) \quad V = \frac{N_e V_e + N_i V_i}{N_e + N_i} = \underbrace{\frac{N_i}{N_e + N_i}}_{\text{slope}} V_i + \underbrace{\frac{N_e V_e}{N_e + N_i}}_{\text{intercept}}$$

line

$$(b) \quad \lim_{N_i \rightarrow \infty} \frac{N_e V_e + N_i V_i}{N_e + N_i} \quad | \div N_i$$

$$= \lim_{N_i \rightarrow \infty} \frac{\frac{N_e V_e}{N_i} + V_i}{\frac{N_e}{N_i} + 1} = V_i$$

$$(c) \quad \lim_{V_e \rightarrow -\infty} \frac{N_e V_e + N_i V_i}{N_e + N_i} = \frac{N_e (-\infty) + \text{number}}{\text{number} > 0} = -\infty$$

(from the context we know that $N_e, N_i > 0$)

$$4. (a) \quad b_{t+1} = \frac{2.7a b_t^{\alpha+1}}{1.3 + b_t^2} = \underbrace{\frac{2.7a b_t^\alpha}{1.3 + b_t^2}}_{\text{per capita production}} \cdot b_t$$

$$(b) \quad b^* = \frac{2.7a (b^*)^{\alpha+1}}{1.3 + (b^*)^2}$$

$$b^* - \frac{2.7a(b^*)^{\alpha+1}}{1.3+(b^*)^2} = 0$$

$$b^* \left[1 - \frac{2.7a(b^*)^{\alpha}}{1.3+(b^*)^2} \right] = 0$$

so $b^* = 0$ is one equilibrium (makes sense: no bacteria to start with means no bacteria in future)

remaining equilibria:

$$1 - \frac{2.7a(b^*)^{\alpha}}{1.3+(b^*)^2} = 0$$

$$2.7a(b^*)^{\alpha} = 1.3+(b^*)^2$$

(c) $a=1, \alpha=2 \rightarrow 2.7(b^*)^2 = 1.3+(b^*)^2$
 $1.7(b^*)^2 = 1.3$

$$b^* = \pm \sqrt{1.3/1.7} \approx \pm 0.87$$

→ makes no sense

thus $b^* = 0.87$ (millim) is an equilibrium

5(a) p.c.p. = $a e^{-mb^*} - d e^{-nb^*} + 1$

(b) $b^* = b^* (a e^{-mb^*} - d e^{-nb^*} + 1)$

$$b^* (\cancel{1} - a e^{-mb^*} + d e^{-nb^*} - \cancel{1}) = 0$$

so $b^* = 0$ or $a e^{-mb^*} = d e^{-nb^*}$

always
equilibrium
(no conditions
on parameters needed)

$$e^{-mb^* + nb^*} = \frac{d}{a}$$

$$e^{(n-m)b^*} = \frac{d}{a}$$

so $(n-m)b^* = \ln(d/a)$

$$b^* = \frac{\ln(d/a)}{n-m}$$

by assumption, $n-m > 0$; for b^* to be positive, $\ln(d/a) > 0$

i.e. $\frac{d}{a} > 1$ or $d > a$

6. (a) Simplify: $AIC = n(\log SS - \log n) + 2K + C$

Thus $AIC' = (\log SS - \log n) + n(0 - \frac{1}{n \ln 10}) + 0$
 product rule $\nearrow = \log \frac{SS}{n} - \frac{1}{\ln 10}$

(b) $\lim_{n \rightarrow \infty} (n \log(\frac{SS}{n}) + \underbrace{2K + C}_{\text{constants}}) = \infty(-\infty) + 2K + C = -\infty$

as $n \rightarrow \infty$, $\frac{SS}{n} \rightarrow 0^+$ and so $\log(\frac{SS}{n}) \rightarrow -\infty$

7. (a) $S(d) = e^{-\alpha nd - \beta nd^2} = e^{-(\alpha nd + \beta nd^2)}$

by assumption, α, β, n, d are positive

so $\alpha nd + \beta nd^2 > 0$

$-(\alpha nd + \beta nd^2) < 0$

$e^{-(\alpha nd + \beta nd^2)} < e^0 = 1$

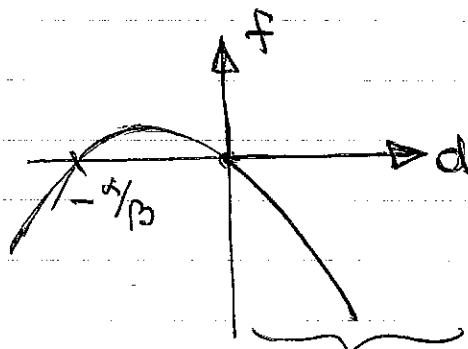

as well, $e^{\text{anything}} > 0 \rightarrow$ so range is $(0, 1)$

(b) S is a composition of two continuous functions: polynomial and exponential function.

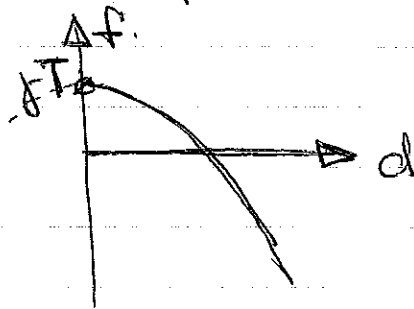

(c) $f(d) = -\alpha nd - \beta nd^2$... parabola, looks like \cap

intucepts $\begin{cases} -\alpha nd - \beta nd^2 = 0 \\ d(-\alpha n - \beta nd) = 0 \end{cases}$

$\rightarrow d = 0$
 $\rightarrow -\alpha n - \beta nd = 0$
 $d = -\frac{\alpha n}{\beta n} = -\frac{\alpha}{\beta}$

(d) Shift the graph in (c) fT units up

(e) $S(d) = e^{-\alpha nd - \beta nd^2 + fT}$

$\rightarrow S'(d) = \underbrace{e^{-\alpha nd - \beta nd^2 + fT}}_{>0} (-\alpha n - 2\beta nd) = 0$

\downarrow
 $-\alpha n - 2\beta nd = 0$

$d = -\frac{\alpha}{2\beta}$ is the only critical point
