

# Basic Differentiation Rules

- All rules are proved using the **definition of the derivative**:

$$\frac{df}{dx} = f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$$

- The derivative exists (i.e. a function is differentiable) at all values of  $x$  for which this limit exists.

# The Constant Function Rule

If  $f(x) = k$ , where  $k$  is a constant, then  $f'(x) = 0$ .

**Example:**

$$f(x) = 3$$

$$f'(x) = 0$$

# The Power Rule

If  $f(x) = x^n$ , where  $n \in R$ , then  $f'(x) = nx^{n-1}$ .

## Example:

Differentiate the following.

(a)  $f(x) = x$

(b)  $g(x) = x^{100}$

(c)  $h(x) = \frac{1}{x^6}$

(d)  $s(t) = \sqrt{t}$

# The Constant Multiple Rule

Let  $k$  be a constant.

$$\text{Then } \frac{d}{dx}[k \cdot f(x)] = k \cdot \frac{d}{dx}[f(x)].$$

**Example:**

Find each derivative.

$$(a) \frac{d}{dK} \left[ \frac{Kl(\gamma + 1)^2}{D^4} \right] \quad (b) \frac{d}{dD} \left[ \frac{Kl(\gamma + 1)^2}{D^4} \right]$$

# The Sum/Difference Rule

$$[f(x) \pm g(x)]' = f'(x) \pm g'(x)$$

provided  $f$  and  $g$  are differentiable functions.

## Examples:

Differentiate.

(a)  $f(x) = 3x^4 + 5x^2 - 10$

(b)  $g(x) = \sqrt{5x} + \frac{x}{\sqrt{5}} - \pi^2$

# Using the Derivative to Sketch the Graph of a Function

**Example:**

Sketch the graph of  $F(x) = x + \frac{1}{x}$ .

# Derivative of the Natural Exponential Function

## Definition:

The number  $e$  is the number for which

$$\lim_{h \rightarrow 0} \frac{e^h - 1}{h} = 1$$

## Natural Exponential Function:

$$f(x) = e^x$$

# Derivative of the Natural Exponential Function

## Note:

This definition states that the slope of the tangent to the curve at  $(0,1)$  is exactly 1, i.e.

$$\begin{aligned}f'(0) &= \lim_{h \rightarrow 0} \frac{e^{0+h} - e^0}{h} \\ &= \lim_{h \rightarrow 0} \frac{e^h - 1}{h} \\ &= 1\end{aligned}$$

# Derivative of the Natural Exponential Function

If  $f(x) = e^x$ , then  $f'(x) = e^x$ .

***In words:***

The slope of the tangent line to the curve  $f(x) = e^x$  at the point P is equal to the value of the function at P.
