
Challenge Exercise 3
MATH 1281 – 2009/10
Due Date: Feb 5, 2010

These challenge exercises ask you questions about material covered in class, but at a greater depth. You are not required to do this exercise; it is intended as extra work. However, you will receive extra credit if you complete the problem correctly.

When handing this assignment in, please clearly label your work as a Challenge Exercise. Make sure to include your name. *I'm looking more for more than a number; make sure you explain how you got your answer.*

Problem. Consider a standard 8×8 chessboard. In chess, the king can move one position in any direction on this board.

- (a) **[2pts]** Suppose we decided to limit the king's moves to either moving one position up or one position to the right. Along how many different paths can a king be moved from the lower-left corner position to the upper right-corner position on the standard 8×8 chessboard?
- (b) **[2pts]** How many of the above paths in Part (a) begin with 3 moves to the right?
- (c) **[3pts]** Repeat Part (a), but now assume that the king can move one position up, to the right, or diagonally north-east.
- (d) **[3pts]** Again, suppose that the king can only move one position up and one position to the right. However, this time when the the king moves from the lower-left corner position to the upper right-corner position, we do not allow the king to move above the diagonal of the board. That is, the king must only travel on or below the diagonal of the board. Count the number of ways to travel between the two corners.
