## MATH 1281 FINAL EXAM INFO SHEET

The purpose of this handout is to help you study by listing the concepts, definitions, and results you will need to know for the final exam.

**Final Exam Information.** The exam will be on **Wednesday, April 14, 2010 at 9:00AM - 12:00PM** in the **RC 0005**. You will **not** be allowed to bring in any notes, use the text book, or use a calculator. If a question involves a calculation you may leave it in an unexpanded form, e.g., you can write  $5^4$  instead of 625, or  $C(6,3)$  instead of 20.

### Bring your Student ID!

**Material Covered.** The exam will be cumulative. The exam will cover the material discussed in class about Chapters 1-11. The questions on Chapters 1-8 will be worth approximately 60% of the exam's total, while the material from Chapters 9-11 will be worth the other 40%.

For more information on what you should know from Chapters 1-9.4, please consult previous handouts. If you are missing these handouts, you can download them from the web at

[http://flash.lakeheadu.ca/~avantuy1/courses/2009\\_10\\_math1281.html](http://flash.lakeheadu.ca/~avantuy1/courses/2009_10_math1281.html)

I have provided a breakdown of what you will need from Chapters 9.5-11 below.

- (1) **Section 9.5** Be able to determine if a graph has an Euler path or circuit, or a Hamilton path or circuit. Also know how to use Theorem 1, 2 and 3.
- (2) **Section 9.6** Know the definition of a weighted graph. Also, you should be able to find the smallest path in a weighted graph.
- (3) **Section 9.7** Know the definition of a planar graph. Also know Theorem 1, Corollary 1, as well as Theorem 2. You should also know the definition of an elementary subdivision, and a homeomorphic graph. As well, you should be able to use Theorem 2 to determine if a graph is planar.
- (4) **Section 9.8** Know what a coloring is, as well as the chromatic number. You should be able to determine the chromatic number for a given graph.
- (5) **Section 10.1** You will need to know the definition of a tree, plus terms like: child, siblings, ancestors, descendants, leaf, root, parent, internal vertices,  $m$ -ary tree, full  $m$ -ary tree, level, and height. You will also need to know how to use Theorem 4.
- (6) **Section 10.2** You should be able to construct binary search trees, like Example 1.
- (7) **Section 10.3** You do not need to know this section.
- (8) **Section 10.4** Given a graph, you should be able to find a spanning tree. You will also need to know how to use the breadth-first search, and depth-first search algorithms for finding spanning trees. Also know what it means to solve problems via a backtracking method.
- (9) **Section 10.5** Given a graph, you should be able to find a minimum spanning tree using both Prim's algorithm and Kruskal's algorithm.
- (10) **Section 11.1** Know the three basic operations in a Boolean algebra - complement, Boolean sum, and Boolean product. Know what a Boolean function is, as well as a Boolean expression. Also, you will be expected to be able to form the dual of a Boolean expression. Know the identities in Table 5. As well, you should be able to determine if two Boolean expressions are equivalent.
- (11) **Section 11.2** Given a Boolean function, you should be able to find a Boolean expression that represents this function. For example, see Example 1. Know how the two operators NOR and NAND are defined. Also know what it means for a set of operators to be functionally complete.
- (12) **Section 11.3** Know the three basic logic gates - inverter, AND gate, and OR gate. As well, you should be able to do questions like Examples 1 and 2.
- (13) **Section 11.4** Know how to use a Karnaugh map to simplify a circuit. Be able to do problems like Exercises 4 and 12.

**The Weighting of the Exam.** Please note that in calculating your final mark, I will be using the following scheme. I will calculate your mark in two ways: (1) The first way is the way described on the course handout, i.e., each test will be worth 12.5% of your final mark. (2) The second way is to drop your lowest midterm, and add its weight to the final exam. So your midterm mark will be worth 37.5% and is based upon your three highest midterms, and your final exam will count for 52.5% of your mark. I will then take the highest of the two methods.

**Note.** I will be available most days before the exam in my office to answer questions. Please feel free to drop by to ask me a question, or send me a question via email ([avantuy1@lakeheadu.ca](mailto:avantuy1@lakeheadu.ca)) or by phone (343-8228).

Good luck and have a good summer! Adam
